GPT-6 Astra clears all 48 Captcha levels, blurring the line between humans and bots

GPT-6 Astra has completed all 48 challenges in Neal Agarwal's “I Am Not a Robot” game, a test built around different CAPTCHA-style tasks.

AI agents outperform humans: bot activity now exceeds that of humans online

Ahead of schedule, this historic milestone has recently been officially confirmed: the internet will never be the same again,...

Jul 1, 2026

The hypothesis

H_0 (null): Humans and the selected AI model are equally accurate at reading striped codes.

H_1 (alternative): Humans are more accurate than the selected AI model at reading striped codes.

The experiment

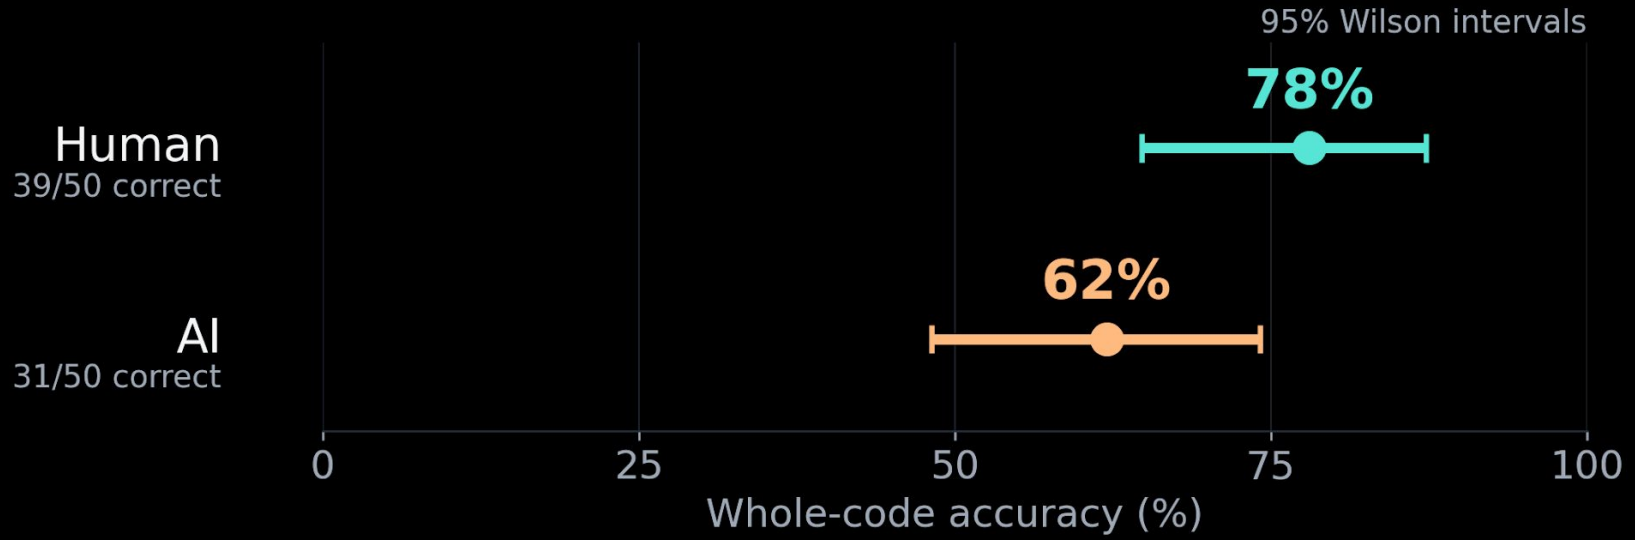

The Process →

The Data

The Results

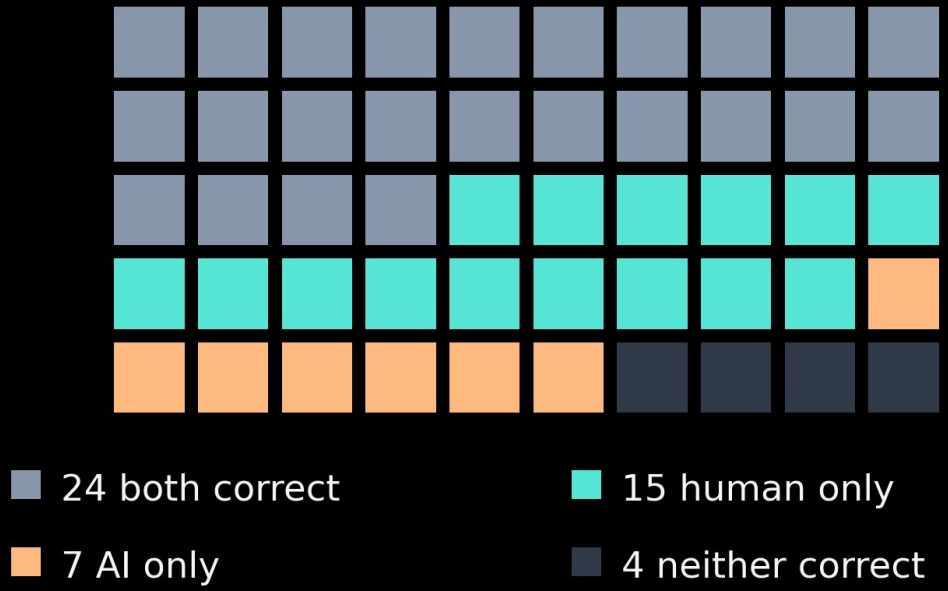

Humans led in this sample

A 16-point lead in this sample.

Intervals show sampling uncertainty. The paired test comes next.

The 22 disagreements matter

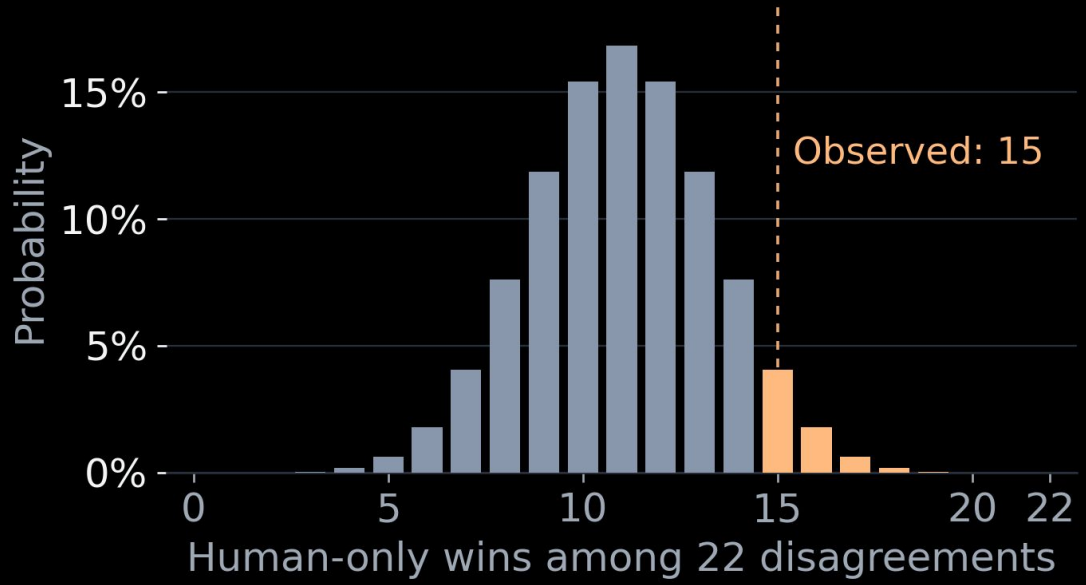

15 vs 7

human-only vs AI-only correct responses

Exact McNemar Test

Could equal accuracy produce this result?

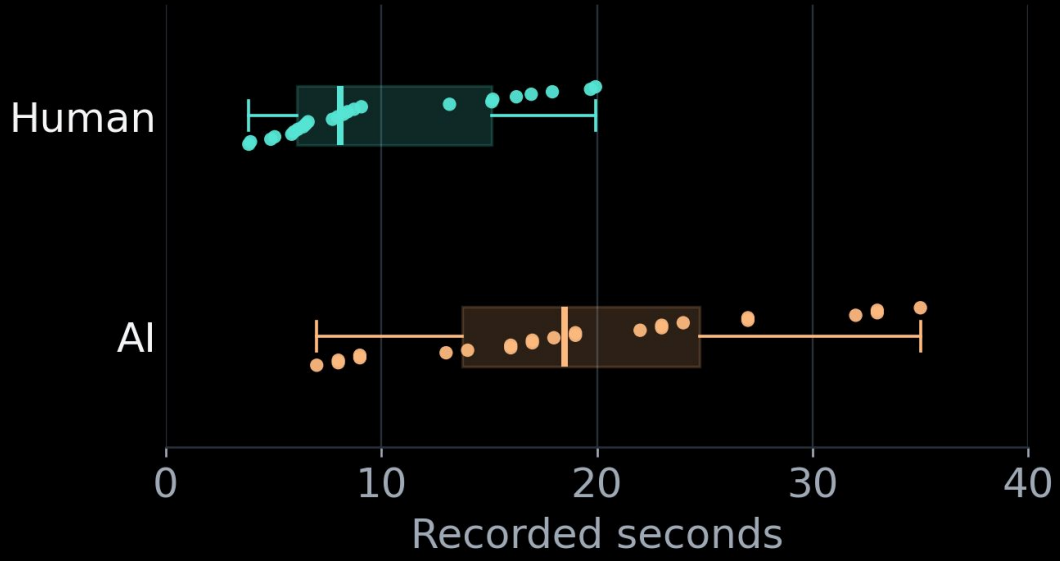

p = 0.067

Not conclusive

One-sided exact test.
Above the 5% cutoff.

Gap: +16 points. Approx. 95% paired interval: −2 to +34.

Different clocks, different recorded times

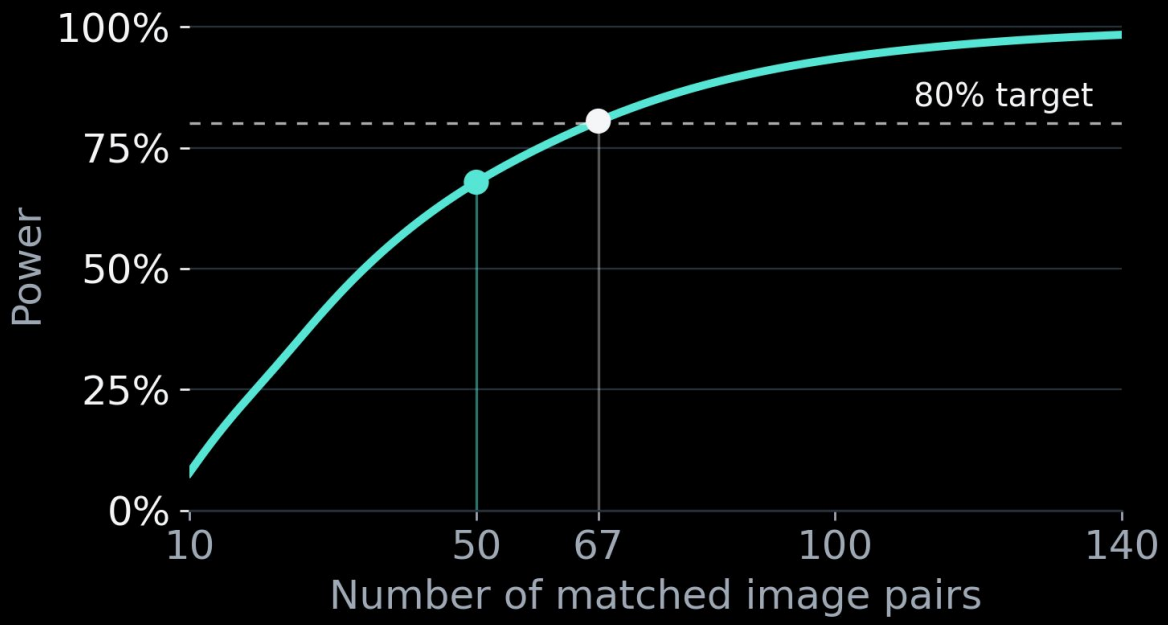

Time (s)	Human	AI
Mean	9.98	19.54
Median	8.11	18.50

24 images both solved correctly

Descriptive only—not a reading-speed test.

Human: measured time, max 20 s. AI: the interface “Worked for…” label.

Why sample size matters

68%

power with 50 pairs

~67 pairs

for 80% power

Illustrative 20-point gap; calculated after collection. Assumptions in notes.

What the evidence tells us

Humans led here.
We cannot yet call the advantage reliable.

6 → 7 → 8
Test code length
